FIT RULES Version 5.0 [XXX], 2016 Section 2.1	<p>There has been significant development in Thermoelectric generators (TEG's) to capture waste heat and convert it to electricity.</p> <p>TEG's can meet the requirements of section 2.1. This technology is being adopted currently in many countries.</p> <p>The FIT program will need to be updated to add this technology at some point in the near future. TEG's can provide power from industrial waste heat 24/7. Solar is only good during the day.</p> <p>The province could benefit from this technology to meet its long term energy requirements. How can we help to contribute to the FIT program for this technology addition?</p> <p>System designs are available.</p>
