

Data Reconciliation – 10 MW Limit

RMSC 4 Oct 2007

- CH 6 Appendix 1.5 requires routine testing 1, 2, or 4 times a year depending on whether the facility has an average annual maximum monthly load of more or less than 10 MW.
- Greater than 10 MW means a higher frequency of routine testing.
- The IESO's has been working out the average since market open and if the MMP had any year >10 MW then they had to do the higher testing frequency.
- Participants could go higher but not lower.

- The IESO will change to using the average annual maximum monthly load based on the previous calendar year.
- This will start on the 1st Jan 2008.
- 2008's values will be calculated using 2007's numbers.
- No change for the balance of 2007.
- IESO systems ready to go.
