**Subject:** GTA West (Peel/Halton) Regional Planning

Hello,

I have a request with respect to the GTA West webinar that took place on August 5, 2020 covering the discussion on the 2021 IRRP for the region. Slides 14 and 16 of the presentation contain graphs displaying summer peak demand forecasts for the Pleasant and Halton “pockets” of the system, respectively. Could you please provide tables in Excel or CSV containing the underlying data? Further, could you provide more detail on how peak demand is exceeding the thermal limits (e.g., by how many MWs, how many hours, what are the limits, etc.)? Specifically, I would like to understand how a NWA resource would need to behave in order to address these system needs.

Thanks,

**Nathan Lev, JD, MES.**
